

Our Commitment to The Environment

In all our activities we actively strive to reduce and recycle wherever possible and when not possible, to carbon offset in order to reduce our impact on the world about us and help preserve our environment for future generations.

We establish targets for minimizing our waste and reducing our emissions to ground, water and air. We monitor and measure the progress of our environmental stewardship and report our findings both in accordance with the applicable statutory requirements and beyond.

We have established procedures and practices to protect the environment during the course of our business activities, onshore and offshore, including the global application of a soft-start procedure for seismic sources as a minimum element in our marine mammal mitigation strategy.

So that we may further limit our environmental footprint, we make use of the latest technologies available in the geophysical and maritime industries including; the use of low sulfur fuels and SCR (Selective Catalytic Reduction) catalysts to reduce emissions and through the use of solid streamers coupled with a seismic source which require no lubrication therefore removing any and all oil leakage to the environment we operate in.

We always manage our operations responsibly with the goal of preventing environmental incidents, from the first project planning stages through to project closure.
